#### DETAILED ACTION

#### SUBSTITUTE ACTION

 It appears that the office action mailed on January 8, 2008 has been missing parts that made the office action not complete in a manner to able the applicant respond to it. Hereby the office action mailed on January 8, 2008 has been vacated. This office action is replacing the previous office action and the new time has been set.

Claims 1-11 remained pending and claims 12-16 has been added.

#### Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR
 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on October 9, 2007 has been entered.

## Claim Rejections - 35 USC § 101

2 35 LLS C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 1, 12, 16, are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Applicant's claims are directed to an algorithm. Specifically, claims recites "storing", "pricing" and "simulating", however these steps are mere ideas in the abstract (i.e., abstract idea, law of nature, natural phenomena) that do not apply, involve, for example) and abstract ideas without a practical application are found to be non-statutory subject matter. Therefore, Applicant's claims are non-statutory as they do not produce a useful, concrete and tangible result.

### Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:
 The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1, 12, 16 rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In particular, Claims 1, 12, 16, states " a second pricing engine" where is the first——?, it is For further examination, the examiner interprets the limitation in light of this 112, second rejection.

In particular, Claims 1, 12, 16, recites the word [" basis instruments"].

However this language fails to distinctly claim Applicant's invention because the scope of the claim is

Art Unit: 3692

unclear. Moreover the specification fails to clarify, the meaning of the limitation. Appropriate correction is required.

In particular, Claims 1, 12, 16, states [a first calibration engine connected to said database, wherein said first calibration engine generates calibration parameters from said credit instrument data].

However this language fails to distinctly claim Applicant's invention because the scope of the claim is unclear how the calibration parameters are being used within the claims. Moreover the specification fails to clarify, the meaning of the limitations. Appropriate correction is required.

## Claim Rejections - 35 USC § 103

 The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

5. Claims 1-16, are rejected under 35 U.S.C. 103(a) as being unpatentable over Galperin et al(Hereinafter Galperin US Pub No: 2002/0052836) in view of Dembo et al(Hereinafter Dembo US Patent No: 7, 171, 385)...

As per claim 1, 13-15, Galperin discloses a system for valuing and managing the risk of a plurality of credit instruments, said system comprising:

- a) a database for storing credit instrument data(see column 4 para 0037)
- b) a first calibration engine connected to said database, wherein said first calibration engine generates calibration parameters from said credit instrument data (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066)
- c) a second pricing engine connected to said database and said first calibration engine, wherein said second pricing engine is configured to value said one or more credit instruments according to noarbitrage financial principles, wherein at least one of a net present value and a par-spread Is calculated for each of said one or more credit instruments using current market data (see column 2 para 0019 and column 5 para 0055-0056)
- e) a fourth risk engine connected to said second pricing engine and said third engine for computing a plurality of risk and reward metrics (see column 5 para 0054) and
- f) a report generator connected to said fourth risk engine for generating reports for use in managing risk, (see column 5 para 0062).

Galperin fail to explicitly teach a third engine connected to said second pricing engine for performing simulation-based computations in which a plurality of scenarios are applied to market data to generate a plurality of valuation and exposure measures.

Application/Control Number: 10/051,905

Art Unit: 3692

However Dembo discloses the simulation where a portfolio's monetary value is to be determined over a single period. The MIF simulation is performed on a set of basis instruments, over a set of possible future scenarios and an appropriate time horizon. The financial products comprising the portfolio are mapped to this set of instruments, and the portfolio is mapped to the financial products. The result is a set of MIF values for the portfolio, one for each scenario.(see column 9 lines 16-23 and column 7 lines 56-67 and column 8 lines 1-9).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Galperin to include a third engine connected to said second pricing engine for performing simulation-based computations in which a plurality of scenarios are applied to market data to generate a plurality of valuation and exposure measures taught by Dembo in order to perform valuing of portfolios in terms of risk and values.

As per claim 2, Galperin discloses wherein at least of said plurality of credit instruments is a loan. (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 3, Galperin discloses further comprising at least one input data module for storing data relating to credit instruments in said database. (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 4, Galperin discloses further comprising a portfolio hierarchy server. (see paragraphs 0073, 0077, 0082, 0094-0097, 01210229, 0240, 0274-0280, 0364).

As per claim 5, Galperin discloses wherein , said first calibration engine comprises:

- a) a first module for generating a one or more basis instruments from input data relating to said one or more credit instruments, wherein said input data comprises at least one of prices, ratings, sectors, and terms and conditions:
- b) a second module for generating a first term structure of risk free zero prices and a risk-neutral process for interest rates from one or more basis instruments (see column 2 para 0019 and column 5 para 0055-0056 and column 6 para 0066)
- c) a third module for generating one or more basic spread matrices from said one or more basis instruments and said first term structure of risk-free zero prices;
- d) a fourth module for generating a second term structure of risk-neutral transition matrices and at least one smoothed credit spread matrix using said first term' structure of risk-free zero prices, said module also adapted to develop generators using a transition matrix manager (see column 2 para 0019 and column 5 para 0055-0056 and column 6 para 0066)
- e) a fifth module for generating a third term structure of riskneutral transition matrices for a specific named obligor from said at least one smoothed credit spread matrix, said first term structure of risk-free zero prices, and said second term structure of risk-neutral transition matrices(see column 2 para 0019 and column 5 para 0055-0056 and column 6 para 0066) and f) a sixth module for

Page 5

Application/Control Number: 10/051,905

Art Unit: 3692

generating a plurality of spread volatility matrices. (see column 2 para 0019 and column 5 para 0055-0056 and column 6 para 0066).

As per claim 6, Galperin discloses wherein a at least one of said modules of said calibration engine generates data subsequently stored in a Mark-to-Future cube. (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 7, Galperin discloses wherein said second pricing engine comprising:

- a) a first module for defining a state space;
- b) a second module for generating a state space by modeling the underlying economic behavior driving the exercise of embedded options and other structural features of said plurality of credit instruments((see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).
- a third cash flow generation module for generating cash flows for said plurality of credit instruments, whereby said credit instruments may be subject to different prepayment or credit state assumptions; and
- d) a fourth module connected to said third cash flow generation module for generating a plurality of valuation attributes from said generated cash flows. (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 8, Galperin discloses where the net present value of a credit instrument is calculated by performing a valuation of a plurality of cash flows for the credit instrument. (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 9, Galperin discloses wherein the said valuation of said plurality of cash flows is performed using a lattice valuation technique. ((see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 10, Galperin discloses where said valuation of said plurality of cash flows is performed. (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).xxxxxx

Galperin fail to explicitly teach using Monte Carlo simulation technique.

However Dembo discloses consider the simulation where a portfolio's monetary value is to be determined over a single period. The MtF simulation is performed on a set of basis instruments, over a set of possible future scenarios and an appropriate time horizon. The financial products comprising the portfolio are mapped to this set of instruments, and the portfolio is mapped to the financial products. The result is a set of MtF values for the portfolio, one for each scenario (see column 9 lines 16-23 and column 7 lines 56-67 and column 8 lines 1-9).

Application/Control Number: 10/051,905

Art Unit: 3692

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Galperin to include using Monte Carlo simulation technique taught by Dembo in order to perform valuing of portfolios in terms of risk and values.

As per claim 11, Galperin discloses wherein the par spread of a credit instrument is calculated by determining one or more spreads such that the net present value of the credit instrument equals a specified value. ((see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066).

As per claim 12, Galperin discloses a no-arbitrage-based system liar valuing one or more credit instruments, said system comprising:

- a) database for storing credit instrument data(see column 4 para 0037)
- b) a first calibration engine connected to said database, wherein said first calibration engine generates calibration parameters from said credit instrument data and current market, said credit instrument data comprising market data(see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066)
- c) a second pricing. Engine connected to said database and said first calibration engine, wherein said second pricing engine is configured to value said one or more credit instruments s according to no-arbitrage financial principles, wherein in least one or a net present value and a parspread is each calculated for each of said one or more credit instruments current market data (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066)
- e) a fourth risk engine connected to said second pricing engine and said third engine for computing a plurality or risk and reward matrix from said valuation and exposure measures(see column 5 para 0054) and
- f) a report generator connected to fourth risk engine for generating reports for use in managing risk. wherein the second pricing engine is configured to produce at least one risk-neutral transition matrix. (see column 5 para 0062).

Galperin fail to explicitly teach a third engine connected to said second pricing engine for performing simulation based computations in which a plurality of scenarios arc applied to market data to generate a plurality of valuation and exposure measures

However Dembo discloses consider the simulation where a portfolio's monetary value is to be determined over a single period. The MtF simulation is performed on a set of basis instruments, over a set of possible future scenarios and an appropriate time horizon. The financial products comprising the portfolio are mapped to this set of instruments, and the portfolio is mapped to the financial products. The result is a set of MtF values for the portfolio, one for each scenario.(see column 9 lines 16-23 and column 7 lines 56-67 and column 8 lines 1-9).

Application/Control Number: 10/051,905

Art Unit: 3692

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the teachings of Galperin to include a third engine connected to said second pricing engine for performing simulation based computations in which a plurality of scenarios are applied to market data to generate a plurality of valuation and exposure measures taught by Dembo in order to perform valuing of portfolios in terms of risk and values.

As per claim 16, Galperin discloses a non arbitrage based system for valuing one or more credit instruments said system comprising:

- a database for storing credit instruments data(see column 4 para 0037)
- a first calibration parameters from said credit instruments data and current market data, said credit instrument data (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066)

said credit instrument data comprising market data the first calibration engine having a first module for generating one or more basis instruments from input data relating to said one or more credit instruments wherein said input data comprises at least one of prices, rating, sectors, and conditions, a second module for generating a first term structure (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0056)

matrices and at least one smoothed credit spread matrix using said First term structure of riskfree zero prices, said module also configured to develop generators using a transition matrix manager.

- a fifth module for generating a third tern-; structure of risk-neutral transition matrices for a specific named obligor from said al least one smoothed credit spread matrix, said first term structure OF risk free zero prices, and said second term structure or risk-neutral transition matrices, and a sixth module for generating a plurality of spread volatility matrices (see column 2 para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066)
- a second pricing engine connected to said database and said first calibration engine said second pricing engine is configured to value said one or more credit instruments; according to no-arbitrage financial principles, wherein at least one of a net present value and a par-spread is calculated for each of said one or mire credit instruments using current market data, having a first module for defining a state space, a second module for generating a state space by modeling the underlying economic behavior driving Mc exercise of embedded options and other structural features of said plurality of credit instruments, a third cash now generation module for generating cash flows for said plurality of credit instruments, whereby said credit instruments may be subject to different prepayment or credit stale assumptions, and a fourth module connected to said third cash flow generation module for generating a plurality of attributes from said generated cash flows, (see column 2

Art Unit: 3692

para 0002 and column 3 para 0025 and column 4 para 0037 and column 5 para 0054 and column 6 para 0066)

a fourth risk tine connected to said second pricing engine and said third engine computing a plurality of risk and reward metrics from said valuation and exposure measure (see column 5 para 0054) and a report generator connected to said fourth risk engine for generating reports for list! in managing risk(see para (see column 5 para 0062).

Galperin fail to explicitly teach a third engine connected to said second pricing engine for performing simulation based computations in which a plurality of scenarios :ire applied to market data to generate a plurality of valuation and exposure measures.

However Dembo discloses consider the simulation where a portfolio's monetary value is to be determined over a single period. The MtF simulation is performed on a set of basis instruments, over a set of possible future scenarios and an appropriate time horizon. The financial products comprising the portfolio are mapped to this set of instruments, and the portfolio is mapped to the financial products. The result is a set of MtF values for the portfolio, one for each scenario.(see column 9 lines 16-23 and column 7 lines 56-67 and column 8 lines 1-9).

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the leachings of Galperin to include a third engine connected to said second pricing engine for performing simulation based computations in which a plurality of scenarios are applied to market data to generate a plurality of valuation and exposure measures taught by Dembo in order to perform valuing of portfolios in terms of risk and values.

Art Unit: 3692

#### CONCLUSION

Applicant's arguments that filed 10/9/2007 has been fully considered but they are moot in view of new grounds of rejections.

7. Applicant's claims 1, 5,12, 16, states " configured to value, configured to develop, configured to produce" "

However the subject matter of a properly construed claim is defined by the terms that limit its scope. It is this subject matter that must be examined. As a general matter, the grammar and intended meaning of terms used in a claim will dictate whether the language limits the claim scope. Language that suggests or makes optional but does not require steps to be performed or does not limit a claim to a particular structure does not limit the scope of a claim or claim limitation. The following are examples of language that may raise a question as to the limiting effect of the language in a claim:

- (A) statements of intended use or field of use,
- (B) "adapted to" or "adapted for" clauses.
- (C) "wherein" clauses, or
- (D) "whereby" clauses.

This list of examples is not intended to be exhaustive. See also MPEP § 2111.04.

\*\*>USPTO personnel are to give claims their broadest reasonable interpretation in light of the supporting disclosure. In re Morris, 127 F.3d 1048, 1054-55, 44 USPQ2d 1023, 1027-28 (Fed. Cir. 1997). Limitations appearing in the specification but not recited in the claim should not be read into the claim. E-Pass Techs., Inc. v. 3Com Corp., 343 F.3d 1364, 1369, 67 USPQ2d 1947, 1950 (Fed. Cir. 2003) (claims must be interpreted "in view of the specification" without importing limitations from the specification into the claims unnecessarily). In re Prater, 415 F.2d 1393, 1404-05, 162 USPQ 541, 550-551 (CCPA 1969). See also In re Zletz, 893 F.2d 319, 321-22, 13 USPQ2d 1320, 1322 (Fed. Cir. 1989) ("During patent examination the pending claims must be interpreted as broadly as their terms reasonably allow.... The reason is simply that during patent

interpreted as broadly as then terms reasonably anow... The reason is simply that during patent prosecution when claims can be amended, ambiguities should be recognized, scope and breadth of language explored, and clarification imposed... An essential purpose of patent examination is to fashion claims that are precise, clear, correct, and unambiguous.

Only in this way can uncertainties of claim scope be removed, as much as possible, during the administrative process.").<

Where an explicit definition is provided by the applicant for a term, that definition will control interpretation of the term as it is used in the claim. Toro Co. v. White Consolidated Industries Inc., 199 F.3d 1295, 1301, 53 USPQ2d 1065, 1069 (Fed. Cir. 1999) (meaning of words used in a claim is not construed in a "lexicographic vacuum, but in the context of the specification and drawings."). Any special meaning

Page 10

Application/Control Number: 10/051,905

Art Unit: 3692

assigned to a term "must be sufficiently clear in the specification that any departure from common usage would be so understood by a person of experience in the field of the invention." Multiform Desiccants Inc. v. Medzam Ltd., 133 F.3d 1473, 1477, 45 USPO20 1429, 1432 (Fed. Cir. 1998). See also MPEP § 2111.01.

 Any inquiry concerning this communication or earlier communications from the examiner should be directed to Clement B Graham whose telephone number is 571-272-6795. The examiner can normally be reached on 7am to 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kambiz Abdi can be reached on 571-272-6702. The fax phone numbers for the organization where this application or proceeding is assigned are 571-273-8300 for regular communications and 703-305-0040 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-3900.
